EyeGate Pharma Reaches 75% Randomization of Patients in Pivotal Study

WALTHAM, MA / ACCESSWIRE / September 16, 2019 /EyeGate Pharmaceuticals, Inc. (NASDAQ:EYEG) (“EyeGate” or “the Company”), a clinical-stage company focused on developing products for treating disorders of the eye, announced today that it has completed randomization of over 75% of the patients required for its corneal wound repair pivotal study using the Ocular Bandage Gel (“OBG”) eye drop.

The pivotal study will enroll up to 270 patients requiring corneal wound repair following photorefractive keratectomy (“PRK”) surgery. After enrolling, each patient is required to attend a formal screening to determine their suitability for the surgery. If approved, the surgery is scheduled for approximately 2 weeks post the screening visit, after which the patient is randomized into either the OBG or standard-of-care group. The patient is then required to return for 2 weeks of follow-up visits where the success of their randomized treatment is measured.

About EyeGate

EyeGate is a clinical-stage specialty pharmaceutical company focused on developing and commercializing products for treating diseases and disorders of the eye.

EyeGate’s lead product, Ocular Bandage Gel (“OBG”), is based on a modified form of the natural polymer hyaluronic acid, which is a gel that possesses unique properties providing hydration and healing when applied to the ocular surface. EyeGate is in the clinic for two different patient populations: photorefractive keratectomy (“PRK”) surgery to demonstrate corneal wound repair and punctate epitheliopathies (“PE”), which includes dry eye.

The objective of OBG is to re-epithelialize the cornea, reduce the risk of infection, improve symptoms, and improve ocular surface integrity. Often current treatments fall short as they are ineffective in protecting and enabling corneal re-epithelialization.

If EyeGate achieves successful completion of the PRK pivotal study and subsequent FDA approval, EyeGate believes OBG will be the only prescription hyaluronic acid eye drop in the U.S. and the only eye drop in the U.S. approved for the healing of corneal epithelial defects. Additionally, if the clinical trial for patients with PE is successful, EyeGate believes OBG will be the only eye drop in the U.S. approved for the treatment of PE.

EGP-437, EyeGate’s other product, incorporates a reformulated topically active corticosteroid, Dexamethasone Phosphate, that is delivered into the ocular tissues through EyeGate’s proprietary innovative drug delivery system, the EyeGate II Delivery System.
