AMD Announces Completion of Class B Qualification for First Space-Grade Versal Adaptive SoCs Enabling On-Board AI Processing in Space

First shipments of radiation-tolerant Versal AI Core devices delivering high-bandwidth signal processing and AI inferencing for space applications on track for early next year

SANTA CLARA, Calif., Nov. 15, 2022 (GLOBE NEWSWIRE) -- [AMD](#) (NASDAQ: AMD) today announced it has completed Class B qualification for the company's first space-grade [Versal™](#) adaptive SoCs. The XQR Versal™ AI Core XQRVC1902 devices deliver full radiation tolerance, accelerated AI inferencing and high-bandwidth signal processing performance for satellite and space applications. The completion of Class B qualification, derived from the US military specification MIL-PRF-38535, allows the devices to begin shipping in early 2023.

The radiation-tolerant XQR Versal AI Core XQRVC1902 devices represent a major leap forward in enabling sophisticated on-board data processing and AI inferencing applications in space. Until now, highly complex AI applications could only be performed with custom-designed ASICs, which are prohibitively expensive for most space programs.

In contrast to ASICs, the XQR Versal adaptive SoC supports reprogramming during development as well as after deployment, including in-flight in the harsh radiation environment of space. This permits satellite operators to change processing algorithms after a satellite has been launched, allowing for previously unavailable flexibility in remote sensing and communications applications. The radiation tolerance of the XQR Versal has been tested by AMD and independent organizations and has been determined to be capable of supporting missions from low-earth orbit to geosynchronous earth orbit and beyond.

"Raytheon is basing our next-generation space processors on the XQR Versal adaptive SoCs due to the chip's performance in various radiation environments and its high quality levels," said Barry Liu, senior director, Space Systems at Raytheon Intelligence and Space. "Its heterogeneous computing capabilities and reconfigurable logic fabric will enable our teams to integrate more on-board processing in a considerably smaller footprint, enabling unprecedented advances in system-level size, weight and power (SWaP)."

7nm Versal Adaptive SoC architecture

The XQR [Versal AI Core](#) adaptive SoCs offer advanced signal processing and AI inferencing capability in a heterogeneous computing platform. The devices feature dual-core Arm® Cortex-A72 and dual-core Arm Cortex-R5 embedded processors, 400 AI/ML compute engines, almost 900,000 logic cells, and 191M bits of memory, all connected with a network-on-chip and fabricated on a 7nm CMOS process.

Developers can produce designs for XQR Versal devices using the AMD Xilinx [Vivado™](#) tool suite and [Vitis™ AI](#) software platform from a variety of developer tools and industry-standard frameworks, including RTL, C and C++, Matlab, Caffe, TensorFlow, PyTorch and others.

“The Class B qualification marks a significant milestone in the introduction of advanced programmable solutions for space applications,” said Minal Sawant, senior director of Aerospace and Defense Vertical Market, AMD. “We have prioritized an accelerated schedule for the Versal adaptive SoC Class B qualification, all while ensuring a thorough and rigorous approach to the testing and analysis necessary to qualify devices for use in space. We are excited to start scheduling customers’ orders for flight-grade Versal devices.”

The AMD Class B qualification and manufacturing test flow is based on the US Department of Defense MIL-PRF-38535 Class B specification for qualification and testing of monolithic integrated circuits and has been adapted for the advanced organic packaging AMD is using for XQR Versal space-grade products.

About AMD

For more than 50 years AMD has driven innovation in high-performance computing, graphics and visualization technologies. Billions of people, leading Fortune 500 businesses and cutting-edge scientific research institutions around the world rely on AMD technology daily to improve how they live, work and play. AMD employees are focused on building leadership high-performance and adaptive products that push the boundaries of what is possible.
