EyeGate Pharma Receives Positive Feedback from FDA Regarding Ocular Bandage Gel Packaging

WALTHAM, MA / ACCESSWIRE / June 11, 2020 /EyeGate Pharmaceuticals, Inc. (NASDAQ:EYEG) ("EyeGate" or "the Company"), a clinical-stage company focused on developing products for treating disorders of the eye, announced today that it has received positive feedback from the U.S. Food and Drug Administration ("FDA") regarding the requested packaging for EyeGate's Ocular Bandage Gel ("OBG") eye drop.

OBG is being developed for corneal wound repair post photorefractive keratectomy ("PRK") surgery and for dry eye patients with punctate epitheliopathies ("PE"). OBG does not include a preservative, which can be irritating and exacerbate these ocular surface indications. EyeGate is seeking to use a multi-dose preservative-free ("MDPF") bottle that is more cost effective and less wasteful compared to the standard mono-dose bottle or individual units typically used for preservative-free topical ophthalmics. The FDA has provided EyeGate with a path forward for using the MDPF bottle, requesting that EyeGate complete some additional tests prior to fully approving the bottle for use. These tests are expected to be completed in the second half of 2020 and are not expected to have an impact on EyeGate's cash runway.

"We are very pleased with this positive feedback from the FDA. With their comments, there is a clear path forward for using the multi-dose preservative-free bottle in future clinical studies and ultimately in commercialization," stated Stephen From, EyeGate's Chief Executive Officer. "We believe that using this packaging will dramatically reduce our cost of goods sold, providing us with more financial flexibility as we continue the development of OBG."

About EyeGate

EyeGate is a clinical-stage specialty pharmaceutical company focused on developing and commercializing products for treating diseases and disorders of the eye.

EyeGate's lead product, Ocular Bandage Gel ("OBG"), is based on a modified form of the natural polymer hyaluronic acid. The product is applied as a clear topical gel, to the damaged ocular surface and possesses unique properties that help hydrate, protect, and heal the ocular surface. EyeGate is in the clinic for two different patient populations: (1) photorefractive keratectomy ("PRK") surgery to demonstrate corneal wound repair after refractive surgery; and (2) punctate epitheliopathies ("PE"), specifically in patients with dry eye.

The objective of OBG is to re-epithelialize the cornea, reduce the risk of infection, improve

symptoms, and improve ocular surface integrity. Often, current treatments fall short because they are ineffective in protecting and enabling corneal re-epithelialization.

If EyeGate receives FDA approval following successful completion of the PRK pivotal study, EyeGate believes OBG will be the only prescription hyaluronic acid ("HA") eye drop in the U.S. and the only eye drop in the U.S. approved for the healing of corneal epithelial defects. Additionally, if the clinical trials for patients with PE are successful, EyeGate believes OBG will be the only HA eye drop in the U.S. approved for the treatment of Dry Eye.
