PharmaCyte Biotech Announces Results of Vote at Annual Meeting of Stockholders

LAGUNA HILLS, Calif.--(BUSINESS WIRE)-- PharmaCyte Biotech, Inc. (OTCQB: PMCB), a biotechnology company focused on developing cellular therapies for cancer and diabetes using its signature live-cell encapsulation technology, Cell-in-a-Box[®], today announced that all 4 proposals presented to the Company's stockholders for a vote at the 2021 Annual Meeting of Stockholders have passed.

PharmaCyte's 2021 Annual Meeting of Stockholders was held on June 16, 2021, and then adjourned until voting concluded on June 30, 2021. The following proposals were approved at the Annual Meeting:

- Proposal One: To elect seven directors as nominated by the Board of Directors, each to serve a one-year term.
- Proposal Two: To approve a Certificate of Amendment to the Company's Articles of Incorporation to increase the number of authorized shares of common stock of the Company.
- Proposal Three: To approve the Company's 2021 Equity Incentive Plan.
- Proposal Four: To ratify the appointment of Armanino LLP as the Company's independent registered public accounting firm for the fiscal year ending April 30, 2022.

About PharmaCyte Biotech

PharmaCyte Biotech, Inc. is a biotechnology company developing cellular therapies for cancer and diabetes based upon a proprietary cellulose-based live cell encapsulation technology known as "Cell-in-a-Box[®]." This technology is being used as a platform upon which therapies for several types of cancer and diabetes are being developed.

PharmaCyte's therapy for cancer involves encapsulating genetically engineered human cells that convert an inactive chemotherapy drug into its active or "cancer-killing" form. For pancreatic cancer, these encapsulated cells are implanted in the blood supply to the patient's tumor as close as possible to the site of the tumor. Once implanted, a chemotherapy drug that is normally activated in the liver (ifosfamide) is given intravenously at one-third the normal dose. The ifosfamide is carried by the circulatory system to where the encapsulated cells have been implanted. When the ifosfamide flows through pores in the capsules, the live cells inside act as a "bio-artificial liver" and activate the chemotherapy drug at the site of the cancer. This "targeted chemotherapy" has proven effective and safe to use in past clinical trials and we believe results in little to no treatment related side effects.

PharmaCyte's therapy for Type 1 diabetes and insulin-dependent Type 2 diabetes involves encapsulating a human liver cell line that has been genetically engineered to produce and release insulin in response to the levels of blood sugar in the human body. PharmaCyte is also considering the use of genetically modified stem cells to treat diabetes. The encapsulation of the cell lines will be done using the Cell-in-a-Box[®] technology. Once the encapsulated cells are implanted in a diabetic patient, we anticipate that they will function as a "bio-artificial pancreas" for purposes of insulin production.
