

Acurx Announces New Microbiome Data from Its Phase 2a Clinical Trial of Ibezapolstat for CDI at the 9th International C. diff. Conference

STATEN ISLAND, N.Y., Nov. 1, 2021 /PRNewswire/ -- Acurx Pharmaceuticals, Inc. (NASDAQ: ACXP) ("Acurx" or the "Company"), a clinical stage biopharmaceutical company developing a new class of antibiotics for difficult-to-treat bacterial infections, announced today that new microbiome data from its Phase 2a clinical trial for *C. difficile* Infection (CDI) will be presented at the 9th Annual International *C. diff* Conference & Health Expo. taking place virtually on November 4-5, 2021.

Title: Ibezapolstat Update: Can Emerging Microbiome Findings Contribute to CDI Anti-Recurrence Effect?"

Presenting Author: Professor Kevin Garey, PharmD, MS, Chair of the Department of Clinical Sciences and Administration and Professor of Pharmacy Practice, University of Houston College of Pharmacy

Date: Friday, November 5, 2021; 11:20am – 11:40am Eastern Time

Registration: Registration is complimentary

About the C. diff Conference and C Diff Foundation:At the C. diff Conference, clinical professionals will gather for eleven (11) hours to present up-to-date data to expand on the existing knowledge and raise awareness of the urgency focused on, but not limited to, *C. difficile* infection (CDI) Prevention, Treatments, Research, Diagnostics, Clinical Trials, AMR, and Environmental Safety. The C. diff Conference is sponsored by the C. Diff Foundation.

Additionally, the Company recognizes the month of November as *C. Difficile* Awareness Month as designated by the US Centers for Disease Control and Prevention (CDC) and supports the work of the C Diff Foundation in educating and advocating for the Prevention, Treatments, Clinical Trials, and Environmental Safety of *Clostridioides difficile* (*C.difficile*) Infections worldwide. <https://cdiffoundation.org/>.

About *Clostridioides difficile* Infection (CDI). According to the 2017 Update (published February 2018) of the *Clinical Practice Guidelines for C. difficile Infection by the Infectious Diseases Society of America (IDSA) and Society of Healthcare Epidemiology of America (SHEA)*, CDI remains a significant medical problem in hospitals, in long-term care facilities and in the community. *C. difficile* is one of the most common causes of health care-associated infections in U.S. hospitals (Lessa, et al, 2015, New England Journal of Medicine). Recent estimates suggest *C. difficile* approaches 500,000 infections annually in the U.S. and is associated with approximately 20,000 deaths annually. (Guh, 2020, New England Journal of Medicine). Based on internal estimates, the recurrence rate of two of the three antibiotics currently used to treat CDI is between 20% and 40% among approximately

150,000 patients treated. We believe the annual incidence of CDI in the U.S. approaches 600,000 infections and has a mortality rate of approximately 9.3%.

About the Microbiome in *Clostridioides difficile* Infection (CDI)

C. difficile can sometimes be a normal component of the healthy gut microbiome, but when the microbiome is thrown out of balance, the *C. difficile* can thrive and cause an infection. After colonization with *C. difficile*, the organism produces and releases the main virulence factors, the two large clostridial toxins A (TcdA) and B (TcdB).

(Kachrimanidou, *Microorganisms* 2020, 8, 200; doi:10.3390/microorganisms8020200.) TcdA and TcdB are exotoxins

that bind to human intestinal epithelial cells and are responsible for inflammation, fluid and mu

About the Ibezapolstat Phase 2 Clinical Trial.

The multicenter, open-label single-arm segment of this study (Phase 2a) is completed and will be followed by a double-blind, randomized, active-controlled segment (Phase 2b) which, together, comprise the Phase 2 clinical trial. The Phase 2 clinical trial is designed to evaluate ibezapolstat in the treatment of CDI. Phase 2a of this trial was an open-label cohort of up to 20 subjects from study centers in the United States. In this cohort, 10 patients with diarrhea caused by *C. difficile* were treated with ibezapolstat 450 mg orally, twice daily for 10 days. All patients were followed for recurrence for 28 ± 2 days. Per protocol, after 10 patients of the projected 20 Phase 2a patients completed treatment, the Trial Oversight Committee assessed the safety and tolerability and made its recommendation regarding early termination of the Phase 2a study. Based on the recommendation of Acurx's Scientific Advisory Board (SAB) and Trial Oversight Committee, we terminated enrollment in Phase 2a early and are now advancing to Phase 2b. The SAB unanimously supported the early termination of the Phase 2a trial after 10 patients were enrolled in the trial instead of 20 patients as originally planned. The early termination was based on the evidence of meeting the primary and secondary endpoints of eliminating the infection (100%), with no recurrences of infection (100%), and with an acceptable adverse event profile. In the upcoming Phase 2b, approximately 64 additional patients with CDI will be enrolled and randomized in a 1:1 ratio to either ibezapolstat 450 mg every 12 hours or vancomycin 125 mg orally every 6 hours, in each case, for 10 days and followed for 28 ± 2 days following the end of treatment for recurrence of CDI. The two treatments will be identical in appearance, dosing times, and number of capsules administered to maintain the blind. This Phase 2 clinical trial will also evaluate pharmacokinetics (PK) and microbiome changes and continue to test for anti-recurrence microbiome properties, including the change from baseline in alpha diversity and bacterial abundance, especially overgrowth of healthy gut microbiota Actinobacteria and Firmicute phylum species during and after therapy.

About Acurx Pharmaceuticals, Inc.

Acurx Pharmaceuticals is a clinical stage biopharmaceutical company focused on developing new antibiotics for difficult to treat infections. The Company's approach is to develop antibiotic candidates that target the DNA polymerase III C enzyme and its R&D pipeline includes antibiotic product candidates that target Gram-positive bacteria, including *Clostridioides difficile*, methicillin-resistant *Staphylococcus aureus* (MRSA), vancomycin resistant Enterococcus (VRE) and drug-resistant *Streptococcus pneumoniae* (DRSP).
