ALUMINIZED TYPE 1 STEEL

Vehicle Exhaust
Residential Furnaces
Dryer Vents
Commercial Baking
Heat Shields

ALUMINIZED TYPE 1 STEEL is continuously hot-dip coated on both sides with an aluminum (Al)/silicon (Si) coating. The hot-dip process, pioneered by Cleveland-Cliffs, provides a tight, metallurgical bond between the steel and the coating. This results in a material with the strength of steel, plus the corrosion protection of aluminum and the synergistic heat protection of an aluminum/silicon alloy.
ALUMINIZED TYPE 1 STEEL

Product Features

CORROSION RESISTANCE
Aluminized Steel Type 1 has superior performance compared to zinc-coated materials for resistance to atmospheric and salt spray corrosion.

FORMABILITY
Aluminized Steel Type 1 can be used to produce parts containing simple bends to parts with deep drawing requirements.

HIGH REFLECTIVITY
Aluminized Steel Type 1 has excellent heat reflectivity during exposures to temperatures below 800 °F (427 °C), reflecting up to 80% of the radiant heat that impinges upon it.

Coating Characteristics

Aluminized Type 1 (T1) coating contains approximately 91% aluminum and 9% silicon that is metallurgically bonded to the steel substrate. The hot-dip coating process assures a tightly adherent, uniform coating on both sides of the product. A schematic of the coating cross-section is shown in Figure 1.

Aluminized Steel Type 1 is supplied in coating weights ranging from T1 13 (0.13 oz./ft²) to T1 60 (0.60 oz./ft²), as shown in Table 1. Most common are T1 25 and T1 40. Lighter coating weights (T1 13 or T1 25) are recommended for severe forming applications. For coating weights not listed, contact your Cleveland-Cliffs Steel sales representative.

Surface Protection and Lubrication

To prevent staining in transit and storage, it is recommended that Aluminized Steel Type 1 be supplied with a rust-preventative protective oil. In some cases, a pre-applied press forming lubricant can be supplied. A dry film (acrylic/polymer) lubricant can also be supplied by further processing Aluminized Steel Type 1 through a coil coating facility. These specialty organic coatings are easily removed with a mild alkaline cleaner.

To further enhance protection against storage stain, a chemical surface treatment (chrome-free) can be applied to Aluminized Steel Type 1. This treatment is not recommended if the final product will be painted unless the appropriate pretreatments are performed.

HIGH TEMPERATURE PROPERTIES
Aluminized Steel Type 1 is an excellent heat-resistant material effective up to 1250 °F (677 °C). For applications above 800 °F (427 °C), where alloying of the coating is a concern, AK Steel’s DQHT grade has been specially formulated to resist alloying at temperatures up to 1000 °F (538 °C). ALUMI-THERM® Steel is a product designed to provide enhanced high temperature strength at temperatures approaching 1400 °F (760 °C).
ALUMINIZED TYPE 1 STEEL

Formability and Mechanical Properties

The formability of all steel products is a result of the interaction of many variables. These variables include: the mechanical properties of the steel, the forming system (tooling) used to manufacture parts and the lubrication used during forming. Of these three, Cleveland-Cliffs can directly affect the mechanical properties of the steel. Tight control over chemical composition, hot rolling parameters, amount of cold reduction, in-line annealing time and temperature, and the amount of additional processing allows the production of high quality Aluminized Steel Type 1 to meet customers’ requirements.

COMMERCIAL STEEL (CS)

Commercial Steel Type B (CS Type B) and Forming Steel Type B (FS Type B) should be used for moderate forming or bending applications. These products are produced from continuously cast slabs, and unless otherwise specified, have a carbon content of 0.02 – 0.15%C and 0.02 – 0.10%C respectively. To prevent the occurrence of fluting or stretcher strains during forming or processing, both products must be ordered as EXTRASMOOTH. These products are subject to aging and the temper rolling effect is temporary.

DEEP DRAWING STEEL (DDS)

For more stringent forming applications, Deep Drawing Steel should be ordered. DDS has a controlled carbon content less than 0.06%C. Interstitial Free (I-F) steel may be supplied at the manufacturer’s discretion unless low carbon is specifically requested at the time of purchase.

EXTRA DEEP DRAWING STEEL (DDS)

Extra Deep Drawing Steel or Extra Deep Drawing Steel Plus (EDDS+) should be ordered for the most demanding forming applications. These steels, also known as Interstitial Free (I-F) steel, are produced from vacuum degassed less than 0.010%C, stabilized grades. EDDS+ has the lowest carbon content available and has been specially formulated to be Cleveland-Cliffs’ most ductile product.

For high strength or structural applications, Aluminized Steel Type 1 is also available in yield strengths up to 50 ksi. (340 MPa).

Aluminized Steel Type 1 can also be specified as Drawing Quality High Temperature (DQHT) for applications where alloying of the coating can be a concern. Cleveland-Cliffs’ DQHT grade has been specially formulated to resist alloying at temperatures up to 1000 °F (538 °C). This product is subject to aging. Materials should be processed within 45 days of aging.

ULTRALUME® PRESS HARDENABLE STEEL (PHS)

ULTRALUME Press Hardenable Steel is available for hot-forming applications. This material is used in hot-stamping applications to achieve final ultimate tensile strength approaching 1500 MPa.

STAINLESS STEEL

An Aluminized Type 1 ferritic (409/439) Stainless Steel is also available.

Typical mechanical properties are shown in Tables 2 and 3, page 5.

**PAINTABILITY**

For best results, Aluminized Steel Type 1 should be cleaned with a mild alkaline cleaner to remove dirt and oil, followed by phosphating with a zinc phosphate. Chromium and aluminum oxides also give good results as a pretreatment on coil coating lines. Mild abrasion prior to pretreating may also be used to enhance mechanical bonding of the paint.

**WELDABILITY**

A variety of welding processes can be used to join Aluminized Steel Type 1, provided that welding procedures are adapted to the special properties of the material.

Resistance spot and projection welding processes are especially suited for Aluminized Steel. High frequency resistance welding and various arc welding processes are also compatible with Aluminized Steel.

For assistance concerning your particular welding parameters, contact your Cleveland-Cliffs sales representative.

**SPECIFICATIONS**

Aluminized Steel Type 1 conforms to ASTM A463. For other specifications, please contact your Cleveland-Cliffs sales representative.

Typical properties produced by Cleveland-Cliffs for these grades.

Commercial Steel, Deep Drawing Steel, and Extra Deep Drawing Steel are designations described in the ASTM Specification A463 "Steel sheet, Aluminum Coated by the Hot Dip Process."

Each of these steel sheet designations is associated with unique requirements for chemical composition and with nonmandatory, typical mechanical properties.

ALUMINIZED TYPE 1 STEEL

OUTSIDE PROCESSING
Tension leveling, re-squaring, slitting, coil coating and cut-to-length are available from Cleveland-Cliffs via arrangements with outside processors.

TECHNICAL ASSISTANCE
Cleveland-Cliffs’s technical representatives can provide you with more detailed information concerning this product. They also are available to assist you in reviewing any welding, forming, painting or other material selection issues.

MILL LIMITS
Aluminized Steel Type 1 is available in thickness ranging from 0.017 – 0.140 in. (0.43 – 3.56 mm) and widths up to 60 in. (1524 mm), depending on dimensions and product quality. For sizes outside of these limits, please ask your Cleveland-Cliffs sales representative.

The standard coil inner diameter is 24 in. (609 mm).

About Cleveland-Cliffs Inc.
Cleveland-Cliffs is the largest flat-rolled steel producer in North America. Founded in 1847 as a mine operator, Cliffs also is the largest manufacturer of iron ore pellets in North America. The Company is vertically integrated from mined raw materials and direct reduced iron to primary steelmaking and downstream finishing, stamping, tooling, and tubing. The Company serves a diverse range of markets due to its comprehensive offering of flat-rolled steel products and is the largest steel supplier to the automotive industry in North America. Headquartered in Cleveland, Ohio, Cleveland-Cliffs employs approximately 25,000 people across its mining, steel and downstream manufacturing operations in the United States and Canada.
