UiPath Accelerates How Customers Can Create Generative AI Applications with New Connector for Amazon Bedrock

New Integration Service Connecter allows developers access to powerful foundational models

NEW YORK--(BUSINESS WIRE)-- UiPath (NYSE: PATH), a leading enterprise automation software company, today announced a new Integration Service Connector that gives customers access to Amazon Bedrock, a fully managed service that provides access to industry-leading foundation models (FMs) via an API to build and scale generative AI applications.

Using UiPath's connector for Amazon Bedrock, automation developers and citizen developers alike can seamlessly integrate Generative AI directly in their UiPath Studio and Studio Web automations, using the model of their preference and within Amazon Web Services (AWS). The connector supports text/chat capabilities through Amazon Titan FMs and several other FMs from leading AI providers via Amazon Bedrock, including the Jurassic-2 family of multilingual large language models (LLMs) from AI21 Labs, which follow natural language instructions to generate text in Spanish, French, German, Portuguese, Italian, and Dutch. Customers can also choose Claude, Anthropic's LLM, which can perform a wide variety of conversational and text processing tasks and is based on Anthropic's extensive research into training honest and responsible AI systems.

"The UiPath connector for Amazon Bedrock is simple to use and brings the power of foundation models to all UiPath customers so they can accelerate building their own Generative AI applications," said Graham Sheldon, Chief Product Officer at UiPath. "With its open, flexible, and responsible approach, UiPath provides organizations with a comprehensive platform for implementing and harnessing the power of AI-powered automation. This functionality complements our vision for helping customers innovate faster with Generative AI."

Generative AI is powered by FMs—very large models that are pre-trained on vast amounts of data. According to AWS, "FMs can perform so many more tasks because they contain such a large number of parameters that make them capable of learning complex concepts. And through their pre-training exposure to internet-scale data in all its various forms and myriad of patterns, FMs learn to apply their knowledge within a wide range of contexts."

In addition, since all data is encrypted and does not leave a customer's Virtual Private Cloud (VPC), customers can trust that their data will remain private and confidential.

Earlier this year, UiPath also announced that data science teams using Amazon SageMaker, an end-to-end machine learning (ML) service, can now quickly and seamlessly connect

Amazon SageMaker-hosted ML models into UiPath business processes without the need for complex coding and manual effort. By connecting Amazon SageMaker to UiPath, users can interact with deployed models via the connector and use their outputs in their workflows.
