Date: August 5, 2020
Time: 9:00 am Eastern Time

About Aerami Therapeutics

Aerami Therapeutics is developing a new generation of inhaled therapies for the treatment of severe respiratory diseases. Our lead product candidate is an inhaled formulation of imatinib (AER-901) delivered via a proprietary handheld nebulizer for the treatment of patients with pulmonary arterial hypertension (PAH), a progressive and currently incurable lung disease. AER-901 has the potential to advance the treatment paradigm for patients with PAH by slowing the progression of the disease. In addition to PAH, we plan to explore additional indications for AER-901 based on imatinib's mechanism of action. We believe respiratory drugs that are specifically designed for inhalation can offer significant benefits compared to other routes of administration. Our product development approach pairs inhaled formulations of existing drugs with proven therapeutic benefit with device technology that optimizes delivery through the lungs to improve safety and clinical outcomes for diseases with high unmet needs. For more information, please visit www.aerami.com.
