PharmaCyte Biotech Releases New Interviews from Austrianova's GMP Facility on Company's Website

LAGUNA HILLS, Calif.--(BUSINESS WIRE)-- [PharmaCyte Biotech, Inc.](#) (OTCQB: PMCB), a clinical stage biotechnology company focused on developing targeted cellular therapies for cancer and diabetes using its signature [live-cell encapsulation technology, Cell-in-a-Box®](#), today announced that its Chief Executive Officer, Kenneth L. Waggoner, remains in Bangkok, Thailand, during the GMP-manufacturing process of its clinical trial material for the treatment of locally advanced, non-metastatic, inoperable pancreatic cancer (LAPC). Dr. Leonard Makowka, the Senior Strategic Advisor to the Chief Executive Officer and the Board of Directors, has now joined him in Bangkok, Thailand.

The company has posted several videos from the Austrianova manufacturing facility on PharmaCyte's website.

The new videos can be seen at www.PharmaCyte.com/media and include a walkthrough of the GMP-manufacturing facility, an interview with PharmaCyte's Chief Executive Officer and an interview with Walter H. Günzburg, the Chairman of Austrianova and PharmaCyte's Chief Scientific Officer. Also, the company has posted a host of pictures on its Facebook page from the manufacturing facility. Those pictures can be viewed at www.Facebook.com/PharmaCyteBiotech

About PharmaCyte Biotech

PharmaCyte Biotech is a clinical stage biotechnology company developing cellular therapies for cancer and diabetes based upon a proprietary cellulose-based live cell encapsulation technology known as "Cell-in-a-Box®." This technology will be used as a platform upon which therapies for several types of cancer and diabetes are being developed.

PharmaCyte's therapy for cancer involves encapsulating genetically engineered human cells that convert an inactive chemotherapy drug into its active or "cancer-killing" form. For pancreatic cancer, these encapsulated cells are implanted in the blood supply to the patient's tumor as close as possible to the site of the tumor. Once implanted, a chemotherapy drug that is normally activated in the liver (ifosfamide) is given intravenously at one-third the normal dose. The ifosfamide is carried by the circulatory system to where the encapsulated cells have been implanted. When the ifosfamide flows through pores in the capsules, the live cells inside act as a "bio-artificial liver" and activate the chemotherapy drug at the site of the cancer. This "targeted chemotherapy" has proven effective and safe to use in past clinical trials and results in little to no treatment related side effects.

PharmaCyte's therapy for Type 1 diabetes and insulin-dependent Type 2 diabetes involves encapsulating a human cell line that has been genetically engineered to produce, store and

release insulin in response to the levels of blood sugar in the human body. PharmaCyte is exploring the use of genetically modified liver cells, stem cells and beta islet cells. The encapsulation will be done using the Cell-in-a-Box[®] technology. Once the encapsulated cells are implanted in a diabetic patient, they will function as a "bio-artificial pancreas" for purposes of insulin production.
