PharmaCyte Biotech to Attend 2022 BIO International Convention in San Diego

LAS VEGAS--(BUSINESS WIRE)-- PharmaCyte Biotech, Inc. (NASDAQ: PMCB) (PharmaCyte), a biotechnology company focused on developing cellular therapies for cancer, diabetes and malignant ascites using its signature live-cell encapsulation technology, Cell-in-a-Box[®], today announced that its Chief Executive Officer, Kenneth L. Waggoner, will represent PharmaCyte at the 2022 BIO International Convention (BIO) being held at the San Diego Convention Center in San Diego, California, June 13-16.

PharmaCyte's Chief Executive Officer, Kenneth L. Waggoner, stated, "We look forward to meeting a host of industry leaders, investors and organizations as we introduce and advance the Cell-in-a-Box[®] technology and the therapies we are developing using this technology. BIO offers a unique opportunity to showcase our novel therapies for cancer, diabetes and malignant ascites to world-class clinicians and scientists who work in our field of endeavor."

The 2022 BIO convention is the world's largest gathering of the biotechnology industry, along with industry-leading investor and partnering meetings held around the world. The host, the Biotechnology Innovation Organization, is the world's largest advocacy association representing member companies, state biotechnology groups, academic and research institutions, and related organizations across the United States and in 30+ countries. The convention will feature 100+ interactive sessions over four days covering a variety of therapeutic areas, business development, digital health, patient advocacy, public policy and next generation biotherapeutics.

About PharmaCyte Biotech

PharmaCyte Biotech, Inc. is a biotechnology company developing cellular therapies for cancer, diabetes and malignant ascites based upon a proprietary cellulose-based live cell encapsulation technology known as "Cell-in-a-Box[®]." This technology is being used as a platform upon which therapies for several types of cancer, diabetes and malignant ascites are being developed.

PharmaCyte's therapy for cancer involves encapsulating genetically engineered human cells that convert an inactive chemotherapy drug into its active or "cancer-killing" form. For pancreatic cancer, these encapsulated cells are implanted in the blood supply to the patient's tumor as close as possible to the site of the tumor. Once implanted, a chemotherapy drug that is normally activated in the liver (ifosfamide) is given intravenously at one-third the normal dose. The ifosfamide is carried by the circulatory system to where the

encapsulated cells have been implanted. When the ifosfamide flows through pores in the capsules, the live cells inside act as a “bio-artificial liver” and activate the chemotherapy drug at the site of the cancer. This “targeted chemotherapy” has proven effective and safe to use in past clinical trials and we believe results in little to no treatment related side effects.

PharmaCyte’s candidate therapy for Type 1 diabetes and insulin-dependent Type 2 diabetes involves encapsulating a human cell line that has been genetically engineered to produce and release insulin in response to the levels of blood sugar in the human body. The encapsulation of the cell line will be done using the Cell-in-a-Box technology. Once the encapsulated cells are implanted in a diabetic patient, we anticipate that they will function as a “bio-artificial pancreas” for purposes of insulin production.

PharmaCyte’s therapy for malignant ascites involves using the same encapsulated cells PharmaCyte employs for pancreatic cancer but placing the encapsulated cells in the peritoneal cavity of a patient and administering ifosfamide intravenously.
