## **Anixa Biosciences' Breast Cancer Vaccine Featured in NewsNation Interview**

SAN JOSE, Calif., June 3, 2025 /PRNewswire/ -- [Anixa Biosciences, Inc.](#) ("Anixa" or the "Company") (NASDAQ: ANIX), a biotechnology company focused on the treatment and prevention of cancer, today announced that its CEO, Dr. Amit Kumar, was interviewed on NewsNation's "Elizabeth Vargas Reports" to discuss Anixa's breast cancer vaccine. The segment highlighted the potential of Anixa's vaccine to revolutionize the treatment and prevention of breast cancer.

Anixa's breast cancer vaccine is designed to train the immune system to recognize and eliminate cancerous cells before they can develop into invasive tumors. The vaccine targets a lactation protein,  $\alpha$ -lactalbumin, which is only expressed in the breast when a woman is lactating but not at other times in her life or in other tissues. However, when a woman develops breast cancer many of the malignant cells will express  $\alpha$ -lactalbumin. Activating the immune system, through vaccination, to direct cytotoxic T cells to the tumor cell expressing this protein may provide preemptive immune protection against emerging breast tumors that express  $\alpha$ -lactalbumin.

"We are pleased to have our breast cancer vaccine featured on NewsNation's 'Elizabeth Vargas Reports,' as this national exposure brings greater awareness to the importance of preventative cancer immunotherapy," said Dr. Kumar. "We believe we have made significant progress in the development of this vaccine, having recently completed enrollment in the Phase 1 clinical trial. We look forward to the next stage of development and are optimistic about the impact this vaccine could have in the treatment and prevention of breast cancer."

### **About Anixa Biosciences, Inc.**

Anixa is a clinical-stage biotechnology company focused on the treatment and prevention of cancer. Anixa's therapeutic portfolio consists of an ovarian cancer immunotherapy program being developed in collaboration with Moffitt Cancer Center, which uses a novel type of CAR-T, known as chimeric endocrine receptor-T cell (CER-T) technology. This technology is differentiated from other cell therapies as the natural ligand of the FSHR receptor, FSH, binds to the FSHR receptor on the tumor cell instead of an antibody fragment. Moffitt is a

world leader in cancer immunotherapy treatments, pioneering next-generation cell therapies such as CAR-T, and tumor infiltrating lymphocytes (TILs) to harness the power of the immune system. The Company's vaccine portfolio includes vaccines being developed in collaboration with Cleveland Clinic to treat and prevent breast cancer and ovarian cancer, as well as additional cancer vaccines to address many intractable cancers, including high incidence malignancies in lung, colon, and prostate. These vaccine technologies focus on immunizing against "retired" proteins that have been found to be expressed in certain forms of cancer. The breast and ovarian cancer vaccines were developed at Cleveland Clinic and exclusively licensed to Anixa. Cleveland Clinic is entitled to royalties and other commercialization revenues from the Company related to these vaccine technologies. Anixa's unique business model of partnering with world-renowned research institutions on all stages of development allows the Company to continually examine emerging technologies in complementary fields for further development and commercialization.
