## Timing / SPI Control

Tuning Algorithm: Binary equivalent to desired tune Frequency [MHz]

The SAX280 Tunable Filter is controlled as a slave SPI device. The SPI interface is used to input a 16-bit filter select word. This interface is Write-only so there are only three SPI signals required:

- CS input: When CS is low, the SPI bus is enabled.  
When CS is high, signals on the other SPI inputs are ignored.
- SCLK: Serial data clock generated by the SPI bus master.
- MOSI: Data from master to slave (Master Out, Slave In).
- MISO: Always Logic Low. [Internally factory set]

The timing of the SPI bus is:

- The base value of the clock is low (0).
- The unit reads the incoming data (MOSI) on the rising edge of the clock SCLK.
- The maximum allowed SCLK rate is 1.0 MHz.

The figure below shows the SPI bus set command operation:

- The SPI bus master sets CS low and generates the SCLK.
- The master sends a 16-bit filter select word (MSB first) on the MOSI line.
- After the last clock pulse, the SPI bus master sets CS high.

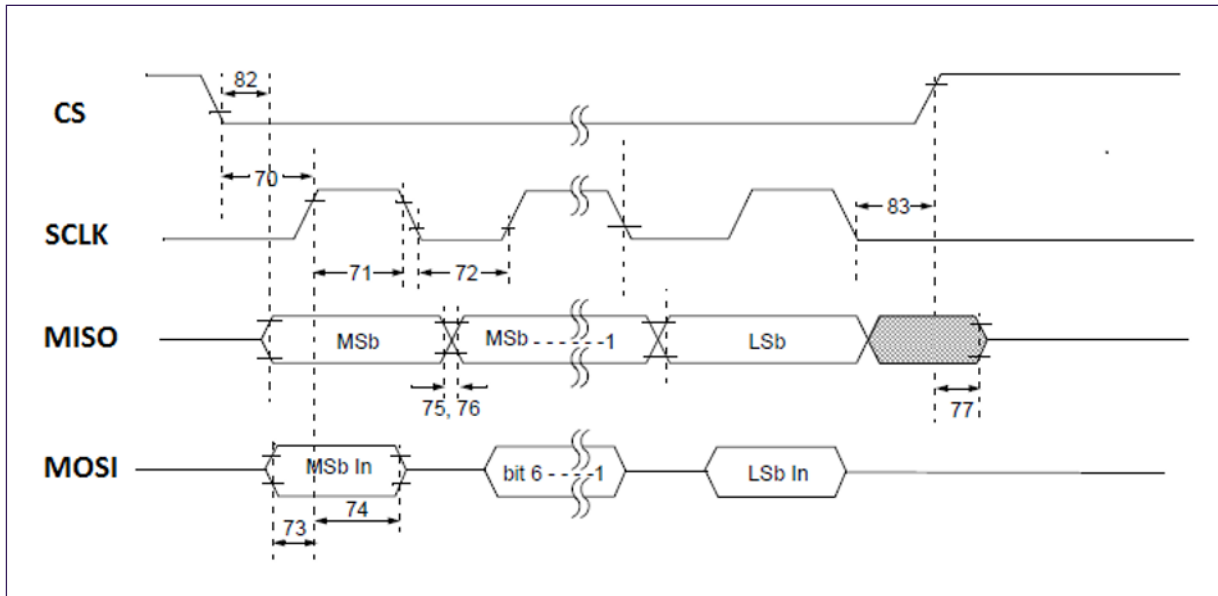

SAX280 uses a +28.0V supply for switches and a +5.0V supply for control.

All Digital I/O are supplied at +5.0V.

- CS input: Logic low = 0.8V Max., Logic High = 2.0V Min.
- SCLK: Logic low = 0.2V Max., Logic High = 4.0V Min.
- MOSI: Logic low = 0.2V Max., Logic High = 4.0V Min.
- MISO: Output is always Logic Low = 0.8V Max.
