# Synthetic Biologics Announces First Patient Dosed in Phase 1b Clinical Trial of SYN-004 for the Prevention of *C. difficile* Infection

**-- On Schedule to Release Topline Data from Phase 1b Clinical Trial and to Start Phase 2 Clinical Trial of SYN-004 in 1Q 2015 --**

ROCKVILLE, Md., Dec. 30, 2014 /PRNewswire/ -- [Synthetic Biologics, Inc.](#) (NYSE MKT: SYN), a developer of pathogen-specific therapies for serious infections and diseases, with a focus on protecting the microbiome, today announced that enrollment has initiated and the first patient was dosed in a Phase 1b clinical trial of SYN-004, an investigational oral beta-lactamase enzyme for the prevention of *Clostridium difficile* (*C. difficile*) infection, antibiotic-associated diarrhea and secondary antibiotic-resistant infections in patients receiving intravenous (IV) beta-lactam antibiotic therapy.

The randomized, double-blind, placebo-controlled Phase 1b study, which is now underway at Clinical Pharmacology of Miami, is designed to further evaluate the safety, tolerability and pharmacokinetics of multiple-ascending doses of oral SYN-004 in healthy volunteers. In all, up to 24 healthy adult volunteers will be enrolled into three cohorts, with six participants receiving SYN-004 and two participants receiving placebo in each cohort. In this Phase 1b clinical trial, six volunteers per cohort will receive increasing doses of SYN-004 by cohort, four times a day over a seven-day period.

"I'm pleased Synthetic Biologics continues to hit its milestones as outlined earlier this year and look forward to a productive 2015," said Jeffrey Riley, Chief Executive Officer of Synthetic Biologics. "Moving Synthetic Biologics' innovative, point-of-care therapeutic approach to prevent *C. difficile* infection through clinical development is high priority for the Company. We look forward to reporting topline data from the Phase 1b clinical trial and initiating enrollment in a Phase 2 SYN-004 clinical trial during the first quarter of 2015."

The U.S. Centers for Disease Control and Prevention (CDC) has identified *C. difficile* as an

"urgent public health threat" and occurs mostly in people who have had recent medical care with IV antibiotics. These antibiotics can create a harmful imbalance in the gut microbiome by killing "good" bacteria, giving *C. difficile* a chance to multiply and cause diarrhea, which can lead to dehydration, fever, abdominal pain, cramping, nausea, colitis, and even death. In all, 24 million Americans receive IV antibiotics annually[i].

SYN-004 is Synthetic Biologics' oral drug candidate designed to be the first and only treatment intended to prevent *C. difficile* infection. Its mechanism of action is to bind with and neutralize certain common IV beta-lactam antibiotics in the gut. During 2012, 14.4 million U.S. patients received approximately 117.6 million doses of IV antibiotics[ii] that could be inactivated in the gastrointestinal (GI) tract by SYN-004. SYN-004 is intended to block the unintended harmful effects of antibiotics within the GI tract, maintaining the natural balance of the bacterial flora (gut microbiome), potentially preventing the 1.1 million *C. difficile* infections[iii] and 30,000 *C. difficile*-related deaths[iv] in the United States each year.

### **About Synthetic Biologics, Inc.**

Synthetic Biologics, Inc. (NYSE MKT: SYN) is a clinical-stage biotechnology company developing pathogen-specific therapies for serious infections and diseases, with a focus on protecting the microbiome. The Company is developing an oral biologic to protect the gastrointestinal (GI) microflora from the effects of intravenous (IV) antibiotics for the prevention of *C. difficile* infection, an oral statin treatment to reduce the impact of methane producing organisms on constipation-predominant irritable bowel syndrome (C-IBS) and a monoclonal antibody combination for the treatment of Pertussis being developed in collaboration with Intrexon Corporation (NYSE: XON). In addition, the Company is developing a Phase 2 oral estriol drug for the treatment of relapsing-remitting multiple sclerosis (MS) and cognitive dysfunction in MS.
