Radeon(TM) Graphics: The Intersection of Speed and Sophistication in the DirectX(R) 12 Era

Exciting new DirectX(R) 12 game and engine partnerships, exclusive hardware features, and winning performance for gamers

SUNNYVALE, CA -- (Marketwired) -- 03/23/16 -- [AMD](#) (NASDAQ: AMD) today once again took the pole position in the [DirectX® 12](#) era with an impressive roster of state-of-the-art DirectX® 12 games and engines, each with extensive tuning for the [Graphics Core Next \(GCN\) architecture](#) at the heart of modern Radeon™ GPUs.

"DirectX® 12 is poised to transform the world of PC gaming, and Radeon GPUs are central to the experience of developing and enjoying great content," said Roy Taylor, corporate vice president, Content and Alliances, AMD. "With a definitive range of industry partnerships for exhilarating content, plus an indisputable record of winning framerates, Radeon GPUs are an end-to-end solution for consumers who deserve the latest and greatest in DirectX® 12 gaming."

"DirectX® 12 is a game-changing low overhead API for both developers and gamers," said Bryan Langley, Principal Program Manager, Microsoft. "AMD is a key partner for Microsoft in driving adoption of DirectX® 12 throughout the industry, and has established the GCN Architecture as a powerful force for gamers who want to get the most out of DirectX 12."

TUNED FOR RADEON GRAPHICS

- [Ashes of the Singularity™](#) by Stardock and Oxide Games
- [Total War™: WARHAMMER®](#) by Creative Assembly
- [Battlezone™ VR](#) by Rebellion
- [Deus Ex: Mankind Divided™](#) by Eidos-Montréal
- [Nitrous Engine](#) by Oxide Games

Total War™: WARHAMMER®

A fantasy strategy game of legendary proportions, Total War: WARHAMMER combines an addictive turn-based campaign of epic empire-building with explosive, colossal, real-time battles, all set in the vivid and incredible world of Warhammer Fantasy Battles.

Sprawling battles with high unit counts are a perfect use case for the uniquely powerful GPU multi-threading capabilities offered by Radeon™ graphics and DirectX® 12. Additional support for DirectX® 12 asynchronous compute will also encourage lightning-fast AI decision making and low-latency panning of the battle map.

Battlezone™ VR

Designed for the next wave of virtual reality devices, Battlezone VR gives you unrivalled

battlefield awareness, a monumental sense of scale and breathless combat intensity. Your instincts and senses respond to every threat on the battlefield as enemy swarms loom over you and super-heated projectiles whistle past your ears.

Rolling into battle, AMD and Rebellion are collaborating to ensure Radeon™ GPU owners will be particularly advantaged by low-latency DirectX® 12 rendering that's crucial to a deeply gratifying VR experience.

Ashes of the Singularity™

AMD is once again collaborating with Stardock in association with Oxide to bring gamers Ashes of the Singularity. This real-time strategy game set in the far future, redefines the possibilities of RTS with the unbelievable scale provided by Oxide Games' groundbreaking Nitrous engine. The fruits of this collaboration has resulted in Ashes of the Singularity being the first game to release with DirectX® 12 benchmarking capabilities.

Deus Ex: Mankind Divided™

Deus Ex: Mankind Divided, the sequel to the critically acclaimed Deus Ex: Human Revolution™, builds on the franchise's trademark choice and consequence, action-RPG based gameplay, to create both a memorable and highly immersive experience. AMD and Eidos-Montréal have engaged in a long term technical collaboration to build and optimize DirectX® 12 in their engine including special support for GPUOpen features like PureHair based on TressFX Hair and Radeon™ exclusive features like asynchronous compute.

Nitrous Engine

Radeon graphics customers the world over have benefitted from unmatched DirectX® 12 performance and rendering technologies delivered in Ashes of the Singularity via the natively DirectX® 12 Nitrous Engine. Most recently, Benchmark 2.0 was released with comprehensive support for DirectX® 12 asynchronous compute to unquestionably dominant performance from Radeon™ graphics.

With massive interplanetary warfare at our backs, Stardock, Oxide and AMD announced that the Nitrous Engine will continue to serve a roster of franchises in the years ahead. Starting with Star Control and a second unannounced space strategy title, Stardock, Oxide and AMD will continue to explore the outer limits of what can be done with highly-programmable GPUs.

Rendering Efficiency with DirectX® 12 Asynchronous Compute

Important PC gaming effects like shadowing, lighting, artificial intelligence, physics and lens effects often require multiple stages of computation before determining what is rendered onto the screen by a GPU's graphics hardware.

In the past, these steps had to happen sequentially. Step by step, the graphics card would follow the API's process of rendering something from start to finish, and any delay in an early stage would send a ripple of delays through future stages. These delays in the pipeline are called "bubbles," and they represent a brief moment in time when some hardware in the GPU is paused to wait for instructions.

What sets [Radeon GPUs](#) apart from its competitors, however, is the [Graphics Core Next architecture's](#) ability to pull in useful compute work from the game engine to fill these bubbles. For example: if there's a rendering bubble while rendering complex lighting, Radeon GPUs can fill in the blank with computing the behavior of AI instead. Radeon

graphics cards don't need to follow the step-by-step process of the past or its competitors, and can do this work together -- or concurrently -- to keep things moving.

Filling these bubbles improves GPU utilization, input latency, efficiency and performance for the user by minimizing or eliminating the ripple of delays that could stall other graphics cards. Only Radeon graphics currently support this crucial capability in DirectX® 12 and VR.

An Undeniable Trend

With five new DirectX® 12 game and engine partnerships; unmatched DirectX® 12 performance in every test thus far; plus, exclusive support for the radically powerful DirectX® 12 asynchronous compute functionality, Radeon graphics and the GCN architecture have rapidly ascended to their position as the definitive DirectX® 12 content creation and consumption platform.

This unquestionable leadership in the era of low-overhead APIs emerges from a calculated and virtuous cycle of distributing the GCN architecture throughout the development industry, then partnering with top game developers to design, deploy and master Mantle's programming model. Through the years that followed, open and transparent contribution of source code, documentation and API specifications ensured that AMD philosophies remained influential in landmark projects like DirectX® 12.

About AMD

For more than 45 years, AMD has driven innovation in high-performance computing, graphics, and visualization technologies -- the building blocks for gaming, immersive platforms, and the datacenter. Hundreds of millions of consumers, leading Fortune 500 businesses, and cutting-edge scientific research facilities around the world rely on AMD technology daily to improve how they live, work, and play. AMD employees around the world are focused on building great products that push the boundaries of what is possible.
