World's First Exascale Supercomputer Powered by AMD EPYC™ Processors and AMD Instinct™ Accelerators

— Frontier supercomputer, powered by AMD EPYC CPUs and AMD Instinct Accelerators, achieves number one spots on Top500, Green500 and HPL-AI performance lists, an industry first —

— AMD powers five of the top ten most powerful and eight of the top ten most efficient supercomputers in the world —

SANTA CLARA, Calif., May 30, 2022 (GLOBE NEWSWIRE) -- Today, [AMD](#) (NASDAQ: AMD) showcased its continued leadership in high performance computing (HPC) by powering the fastest and the most energy efficient supercomputers in the world, according to the latest [Top500](#) and [Green500](#) lists.

Oak Ridge National Laboratory's (ORNL) Frontier system submitted its very first score to the Top500 list of 1.1 exaflops, making it the world's fastest supercomputer and the first to break the exascale barrier. Frontier's performance is more than double the number two system and greater than the sum of the next seven systems on the latest Top500 list.

In addition, the Frontier test and development system (TDS) secured the top spot on the Green500 list, delivering 62.68 gigaflops/watt power-efficiency from a single cabinet of optimized 3rd Gen AMD EPYC™ processors and AMD Instinct™ MI250x accelerators. Finally, Frontier's mixed-precision computing performance clocked in at 6.86 exaflops, as measured by the [High-Performance Linpack-Accelerator Introspection](#), or HPL-AI, test. Next steps for Frontier include continued testing and validation of the system, which remains on track for final acceptance and early science access later in 2022, and open for full science at the beginning of 2023.

In other AMD EPYC and AMD Instinct MI200 systems, [CSC's LUMI supercomputer](#) is third on the Top500 list with 152 petaflops of performance and third on the Green500 list with 51.63 gigaflops/watt power-efficiency, and the Adastra system at GENCI-CINES is tenth on the Top500 list and fourth on the Green500 list. These systems continue to highlight the performance and efficiency capabilities of the AMD Instinct accelerators at a node, cabinet and system level.

Additionally, the Top500 and Green500 lists showcase the rapidly growing preference for AMD solutions across the HPC industry. On the Top500 list, AMD powers 94 total systems, an increase of 95% year-over-year, and AMD Instinct MI200 accelerators made their first entry to the Top500 list with seven systems. The performance number delivered by this single generation of AMD Instinct based systems on the Top500 list almost equals the combined Flops of the rest of the 161 accelerated system on Top500.

On the Green500 list, AMD EPYC processors and AMD Instinct accelerators now power the four most efficient supercomputers in the world. Beyond that, AMD products are in eight of the top ten, and 17 of the top 20 most efficient.

“We are excited that AMD EPYC processors and AMD Instinct accelerators power the world’s fastest, most energy efficient, and first supercomputer to break the exascale barrier,” said Forrest Norrod, senior vice president and general manager, Data Center Solutions Group, AMD. “Innovation and delivering more performance and efficiency for supercomputers is critical to addressing the world’s most complex challenges. AMD EPYC processors and AMD Instinct accelerators continue to push the envelope in high performance computing, providing the performance needed to advance scientific discoveries.”

“The Frontier supercomputer, powered by AMD and HPE, represents a massive step forward for both science and for the HPC industry,” said Bronson Messer, director of science, Oak Ridge Leadership Computing Facility. “Our collaboration with AMD has been critical for us to ensure that we deploy the world’s leading platform for computational science. The Frontier supercomputer taps into the combined performance of enhanced AMD CPUs and AMD Instinct accelerators, along with an enhanced AMD ROCm™ 5 open software platform, to deliver the performance researchers need to carry out scientific research for the good of all mankind.”

“LUMI, one of the EuroHPC world-class supercomputers and leading platforms for artificial intelligence, is built with leadership environmental sustainability and performance in mind,” said Pekka Manninen, Director of the LUMI Leadership Computing Facility, CSC. “AMD EPYC processors and AMD Instinct accelerators enable us to reach our most ambitious scientific research goals while at the same time meeting and exceeding the EU’s most stringent climate targets. We are extremely proud of our third-place position in the Green500 list, achieving 51.63 gigaflops/watt power-efficiency.”

The AMD Powered HPC Ecosystem Continues to Grow

AMD is leading the way in HPC by enabling partners and customers to deploy all sizes of clusters, across key research areas including manufacturing, life sciences, financial services, climate research and more. For instance, AMD EPYC processors now power [Thailand’s National Science and Technology Development Agency’s latest supercomputer](#), providing the performance to advance research in medicine, weather forecasting and more. Additionally, The [Ohio Supercomputer Center](#) recently announced Ascend, a new HPC cluster comprised of Dell Technologies PowerEdge servers powered by AMD EPYC processors.

The [AMD Instinct and ROCm™ ecosystems](#) offer customers support for key applications in HPC, AI and machine learning as well as HIP and OpenMP® programming models, compiler toolchain and analysis tools for scientific and industrial applications. Additionally, the AMD Accelerator Cloud provides an environment to remotely access, evaluate and get the most out of AMD Instinct accelerators and ROCm software.

HPC in the Cloud

HPC in the cloud expands access to compute, unlocking key research applications and business workloads that lead to better designed products and accelerate time to market. [The latest Google Cloud C2D virtual machines](#) (VMs) with confidential computing extend the momentum of AMD EPYC processors powering highly-performant and efficient HPC solutions from leading cloud service providers. [Electric supercar innovator, Rimac](#), recently

deployed Microsoft Azure HBv3 virtual machines – powered by 3rd Gen AMD EPYC™ processors with AMD 3D V-Cache™ technology – to increase performance and scalability for its electric supercar simulations.

About AMD

For more than 50 years AMD has driven innovation in high-performance computing, graphics and visualization technologies. Billions of people, leading Fortune 500 businesses and cutting-edge scientific research institutions around the world rely on AMD technology daily to improve how they live, work and play. AMD employees are focused on building leadership high-performance and adaptive products that push the boundaries of what is possible.
