

Overview

MetaStat is a pre-commercial diagnostic company focused on the development and commercialization of novel Laboratory Developed Tests (LDTs) to provide physicians and patients actionable information regarding the risk of distant systemic metastasis. We believe cancer treatment strategies can be personalized and outcomes improved through new diagnostic tools that more accurately identify the aggressiveness and metastatic potential of primary tumors.

Systemic metastasis, cancer that spreads from a primary tumor to other areas of the body, is responsible for approximately 90% of all solid tumor cancer-related deaths. However, based on management estimates only 30-35% of breast cancer and 15% of prostate cancer tumors are biologically capable of metastatic spread, yet the majority of these patients are treated with aggressive therapies. We are developing two epigenetic-based diagnostic assays, called **MetaSite Breast™** and **MenaCalc™**, which we intend to offer as a LDT service available through our clinical reference laboratory based in Boston, MA. We anticipate receiving CLIA certification in 2015 and to begin commercializing our breast cancer diagnostic tests in 2016.

Our technology platform and corresponding products are the result of over 15 years of collaboration involving four scientific/academic institutions. We believe we are unique and differentiated in the marketplace. Our discoveries are based on direct microscopic visualization of living, functioning tumors in vivo, which enabled us to specifically isolate and thus characterize the behavior, genetics and mechanics of these highly metastatic cells.
